

Read and summarize the following sections from <http://www.cplusplus.com/doc/tutorial/> (If you are new to C++, please read all the sections of this tutorial.)

Yes, there is a lot to read, but a lot of the material will be covered in class.

Object-Oriented Programming:

1. classes (I)
2. classes (II)
3. friendship and inheritance
4. polymorphism

You are required to write a (at least) one page summary of what you have learned from each article. I'd like more than one page, less than 3 pages for all the above sections. Please do not use the examples from the article in your summary. Any examples you use should be your own. Try to compile your examples before putting them in the summary.

Users who already know the material are free to comment on the text, provide me with their insights, opinions, likes and dislikes. If you have any questions to ask on items you have not understood, please add them to your text.

Don't simply repeat and copy/paste what you read. If you make use of any outside references, please state them.
